

Matrox Graphics Inc. brings three important features to **Matrox Maevex 5100 Series H.264 encoders/decoders**that will be demonstrated for the first time at ISE 2014.

Maevex encoders will soon support high quality H.264 video recording to a network-shared drive or NAS at resolutions up to Full HD 1080p60 with zero-latency pass-through of the video and audio signals, making it ideal for medical, transportation, military and surveillance applications.

Maevex decoders will soon provide a built-in fail-safe mode to ensure that pre-recorded digital signage content will automatically play on screen in the event of a lost network connection that interrupts streaming from a Maevex encoder. Clients can store the pre-recorded image or video clip in the decoder's internal flash memory. When network connectivity is restored, the Maevex decoder reverts to the streaming content.

Maevex encoders bring another enhancement to digital signage applications. In addition to streaming to Maevex hardware decoders, Maevex encoders can be used to stream directly to digital signage software players such as those from DISE.

Matrox Maevex 5100 Series encode/decode systems are in use for video distribution over

New Recording & Fail-safe Features for Matrox Maevex

Written by Bob Snyder 12. 02. 2014

standard IP networks for collaborative video walls, manufacturing and automation, process control, digital signage and other applications.

Maevex H.264 encoders and decoders capture, stream, and decode video from a variety of sources for video distribution over IP and allow for software-based decoding on non-Maevex devices.

Bitrates are user definable between 100Kbps and 25Mbps allowing for multiple streams on both 100Mb and 1000Mb standard networks. Alternatively, the Maevex encoder functions as a video recorder, capturing MP4 files to NAS at resolutions up to 1080p60 for later review. Maevex units come bundled with **Matrox PowerStream** software, allowing for easy remote management of Maevex devices and enabling a wide variety of user-defined stream-management or recoding features.

The Matrox Maevex encoder can be used to stream directly to digital signage players now. The new recording feature will be available via firmware upgrade at no additional charge in Q2 2014

. The Maevex decoder, available now, will add the new fail-safe feature via firmware upgrade at no additional charge in Q2, 2014.
