spo-comm presented its new products and hardware solutions for digital signage, kiosk and POS applications—as well as a new "**Easy Customization**" program at ISE 2015. Mini-PCs from their **NANO, KUMO** and **DROID** series can now be customized and branded-- even for very small projects.

Up to 9 displays can be driven by their most recent multi-view system. And for digital signage installation in harsh environments, spo-comm extended **RUGGED** series with a new middle class system, the **RUGGED QM87**.

All new systems and solutions presented will be available in the upcoming three months, says the company.

The latest offering from spo-comm is a professional mini-PC with integrated desktop-CPU. Together with MSI IPC, the mini-PC provider from Nuremberg brings this **spo-book FLEX Q87 (MS-9A78)** to the market.

With the spo-book FLEX Q87, users have the possibility of controlling 3 monitors simultaneously-- an advantage in the day-to-day work.

Apart from the three connectors for monitors, the integrated, high-performance CPU is also an important feature of the new device.

For an operating system, users have a choice between Windows 7 or Windows 8 (in their 32-bit or 64-bit versions, respectively). Alternatively, Ubuntu can also be used. With regard to the installation site, the new Mini-PC can be operated at ambient temperatures of between -10 and 40 degrees.

Go **spo-comm**
