

Visix releases version 1.30 of its **AxisTV Signage Suite** enterprise digital signage platform and V 3.11 of their **Connect Room Sign** software.

The AxisTV Signage Suite release adds an Adjust Message and Adjust Layout workflows to allow users to edit text and media files in fill-in messages and layouts. The Administer Players screen now displays version, last snapshot and last update--and it can reboot or shutdown players. Version 1.30 also includes enhanced SAML authentication configuration in the **AxisTV Manage CMS**.

AxisTV Design, the desktop content design app, adds improvements to the Delphi calendar data widget and synchronization with the CMS. A new widget, Data-Mapped Text Choice, allows designers to specify what text they want to display, based on data available from the source. A basic user scenario would be “show the floor name based on the room number or show the name when the floor name is not available.”

Version 3.11 of their Connect Room Manager application adds two new read-only calendar types – JSON and XML. The **Connect Room Manager Console** offers new backup and restore functionality, and administrators can now enter a room sign’s device shell without first rebooting the device. The release also includes an energy-saver mode, enhancements to the

PIN feature and enhanced logging capabilities.

Both releases can be downloaded from the link provided.
