Remote Media Group's new *signagelive* software tools let digital signage network operators work in the language of their choice (and across any browser or most popular OS) and introduces powerful new content development and playback tools.

Digital signage network operators are no longer restricted to running software developed only in the English language. Using language packs: Signagelive users can choose their native language -- Spanish, for example -- in the web browser settings and then have the content management system delivered in the selected native tongue.

The spring 2011 release upgrades Signagelive's Layout Creator to a fully functional Layout Designer, including image layering, sizing, alignment and other design tools usually reserved for standalone software applications. The Layout Designer also includes template layouts, a library of background images, and enhancements for handling and presenting fonts and RSS feeds.

In addition, a number of social media functions have been integrated including a new QR code widget and feeds from Twitter, Foursquare and Facebook.
