

IntuiLab comes out with **IntuiFace Presentation Version 3.0.3**. IntuiFace Presentation creates rich multi-touch and sensor-enabled presentations as it automatically converts all of your content (images, documents, videos, maps, etc) into interactive assets you can orchestrate into presentations for Windows 7 and Windows 8-based tablets, tabletops, kiosks, digital signs and touchscreen walls.

Version 3.0.3 has new features, including **Remote Actions**. For the first time, presentations can communicate with one another, either on the same machine or over a network.

You call all IntuiFace Presentation actions remotely by specifying the action trigger in your host presentation and details about the target presentation. You can even use the communication syntax in third-party applications to trigger presentation actions over a network. The official release of Remote Actions will include a host of new actions that you don't have today.

Another new action, **Direct URL calling**, lets you call web services from anywhere in a presentation without having to use a Web browser. One example is the use of a web service interface for a room lighting solution. With direct URL calling you can coordinate room lighting with actions in your presentation.

IntuiFace Presentation Version 3.0

Video asset improvements: Video asset now has a progress bar and volume control. This enhancement allows users to jump to any desired section of a video and control the audio.

Support for a new RFID reader, the Touchatag.

Major Preview Mode performance improvement: You will notice a big increase in speed when going into and exiting from Preview Mode.
