**From Taiwan, InterAD adds a network version to their stand-alone hardware/software package for controlling projected content on floor or wall (recommended maximum size is 4x3 meters).**

The network version of InterAD will include a content server, management console and player. You edit your contents and schedule these on the management console in your office, then designate when and what content each player should run, and send all data to the content server. All the players will login to the server automatically to download the necessary data to playback.

All the data transmission is automated (receiving files and updating the contents via the Network) so you don't need to renew the content manually one by one.

InnoVision Labs has developed AMIT (Advanced Motion Identification Technology) software that drives their InterAD networked system. The graphic controller is a Windows- based computer.

The company offers up to 20 content templates where the customer can use his own image (but the effect pattern is fixed so in, for example, a Water/Fish template, the water effect is fixed but you can load your image as the top image and/or the background image). All of images inside templates can be replaced with customized images.

You could only purchase the software from InnoVision Labs if you can take care the PC based graphic controller. They will provide the software and the IR sensor to you. But InnoVision Labs recommends either the stand-alone package which includes software, hardware and contents service or the network version (when you need many individual units).

12 months warranty after delivery of product.
