Christie unveiled at InfoComm a tech preview of the newest members of its Christie MicroTiles solutions family: the **Christie i-Kit touch interactivity kit**, powered by *Baanto ShadowSense*, and the **Christie JumpStart** software and media server.

The Christie i-Kit, a multi-touch interactivity kit suitable for large format displays, attaches to the perimeter of any large arrayed display up to 16 x 6, including Christie MicroTiles, allowing multiple users to interact simultaneously with a rectangular video wall with sufficient resolution and speed to support finger-based gestures.

Easy to install and operate, the innovative Christie JumpStart is an affordable yet high performance front-end content solution suited for delivering informative and attractive content to 5-10 megapixel tiled digital displays such as Christie MicroTiles. Targeted to designers, system integrators and rental/stagers in architecture, out-of-home advertising and event production, Christie JumpStart is the choice for tiled display walls requiring up to four video inputs and outputs.
