Shown at ISE 2013 *[see photo]*, Crystal Displays calls this 70-inch the “**world’s largest transparent display**” and we know of nothing that disputes this.

With most transparent display projects using the Samsung 22” or Samsung 46” panels, Crystal Displays has introduced **new transparent panels to allow customers to upgrade to Full HD (1920 x 1080) resolution.**

The panels are currently available in sizes 26”, 47” and 70” giving companies the option to create better graphics and content which for some applications such as museums, art houses, high end retail / branding and other applications.

CDS can supply these with Media player or interface card (HDMI) solution and Infra Red or projected capacitive touch screen.
