Litemax of Taiwan shows LITILE34, its LCD panel wall.

The company says, "Large-size LCD panels are still restricted by it size (the world largest LCD panel is 108 inch) and brightness (normal brightness – 500nits, not suitable for outdoor applications). In addition, the resolution of LED wall is too low to watch it nearby."

To improve these display restrictions, Litemax developed five core technologies, including Sunlight Readable Tech., Optical Fiber Tech, Thermal Dissipation Solution, Video Wall Mechanical Structure and Video.

LITILE modules

LITILE34 features Sunlight Readable, a brightness of 1200 nits. LITILE34 modules can be stacked up and become an unlimited-size video wall. Moreover, LITILE34 LCD modules are the same as bricks which can be composed for different activities, applications and places.

At a recent product launch conference, Litemax showed an "L-shape" video wall displaying marketing messages created by LITILE modules.
