LG Electronics launched the world's narrowest bezel UHD video wall at GITEX Technology Week in Dubai.

With its super slim bezel size, the **VH7B Direct Backlit LED Display video wall** measures 0.9 mm and caters to sectors including airports, shopping centres and hotels.

The ground breaking video wall display features LG's **webOS for Signage** smart platform, which takes advantage of the built-in high-performance system-on-a-chip (SoC) sync playback that eliminates the need for an external PC or media player to play contents for daisy chain, helping to reduce the total cost of ownership.

LG's webOS for Signage enables a variety of web-based applications across multiple platforms, as well as the ability to write applications using HTML 5. The advantage of this platform is the ease of management and customisation for third party solution providers which makes lives easier for all stakeholders.

In addition to the global debut, LG showcased the 98" ULTRA HD 4K premium signage display, 84" 10-point touch white board, the new ultra-stretched 86" display, and the innovative LG beacon solution demonstrated on 10" compact touch screens.

Also on display was the UHD premium Hospitality TV UX960H designed to provide a connected guest in-room experience. These solutions cater to a range of vertical industries including retail, education and hospitality.
