Vision, investing heavily in wireless DisplayPort and HDMI technology, will show their **TC-HDMI WM Wireless Matrix** product at ISE 2018 in Amsterdam.

The product uses 10 user-selectable 5GHz wi-fi channels. You just set a transmitter and receiver to the same channel and they connect automatically.

The new product wirelessly matrixes, distributes, switches, or a combination of those.

Vision say their two key rules for this system design are: 1) each transmitter must be on different channels (so there is a limitation of ten transmitters per wi-fi area), and 2) a maximum of two receivers can connect to a transmitter.

For switching applications, a “present” button on the transmitters sends a command to the receiver saying “switch to my channel.”

It comes with a remote control, or can be controlled by RS-232.
